## Dual Station Heat Transfer Press

16"x20" 20" x 25"

The **Practix OK-375** automatic heavy-duty dual station machine is specifically designed to suit the needs of many manufacturing and printing operations including dye sublimation and heat transfer printing on a large variety of substrates. Like all Practix heat transfer equipment the dual station shuttle line is made from a heavy-duty steel frame and its simple unitized design gives it an unsurpassed durability and stability for precise printing

Extremely simple in operations, minimum physical effort and high productivity are the results of the dual station system. With this set up, one platen is under the heat source while the other is available for the next substrate. Premium quality transfer is achieved due the electronic temperate and time control system. a high watt density heater on the platen allows the heater increase and maintain temperature during production time
